AFRL awards \$8M contract to CACI Technologies

by Fran Crumb, Information Directorate

ROME, N.Y. — The Air Force Research Laboratory's Information Directorate has awarded an \$8,065,736 contract to CACI Technologies Inc. of Chantilly, Va., to improve signal intelligence capabilities.

The three-year agreement, funded through the Defense Cryptologic Program, will investigate, develop, and integrate new audio enhancements, bitstream processing, improved emitter sorting and identification, and artificial intelligence applications into operational system platforms to improve signal processing capabilities of the warfighter.

“The majority of work under this contract will focus on software engineering, although CACI engineers will produce some specific hardware applications as well,” said Dr. Paul B. Losiewicz, program manager in the directorate's Information and Intelligence Exploitation Division. “Technology provided through this research will enhance current signal intelligence operations.”

The new products will be distributed to operational intelligence sites worldwide. Gail A. Person of the directorate's Contracting Division negotiated the agreement. @
